

## **Phase 7: Integration & External Access**

**Status:** Not required for the Leave Tracker App.

**Reason:**

The Leave Tracker App is a **self-contained application** built entirely within Salesforce. It does not depend on any external systems, APIs, or third-party integrations. All required functionality (leave request submission, approval, and tracking) is handled internally using standard Salesforce objects, flows, and components.

Since no integration or external access is needed, this phase is not applicable to the project.
